1.6 Glossary . . . 2

1.1 Foreword

This template must be compiled with the LuaLaTeX engine. The latter supports modern also called smart fonts (which are used in this document) and some nice packages such as `piton.sty` for including your mind bending vibe coded python scripts. This engine has become over the years the recommended compiler for TeX. Even though I inted to use this template for projects within Europe, it was made with the memoir class and not the more European-adapted koma-script. Nonetheless, memoir provides many functionalities of which many are used through this document.

1.2 The page setup

As you've now noticed, the body text is separated in two columns. This is done by specifying `twocolumn` as an option when calling `\documentclass{memoir}`. This layout allows to maximize the usage of paper (both good for printing and scrolling purposes) while in the meantime allowing for high legibility. In my opinion, it is also the best looking layout when one has large figure panels that don't usually fit within the body text width of legible one column documents. However, two columns also means no margin annotations and figures.

1.3 The overall structure

Lines you are reading now are within the main matter « part » of this document. This is where document divisions are numbered, either by numbers for parts, chapters, sections, etc... or by letters for the appendix material. All the content before sat in the front matter and is usually unnumbered. The same goes for the backmatter in which indexes and the bibliography go.

1.4 A quick word on the babel package

As you may know, TeX and subsequent LaTeX were engineered by us citizens. Therefore, the engine typesets according to American typographic rules. For the rest of us, we can ensure proper formatting accordingly to our respective region by loading the `babel.sty` package. To do so, make sure your region is given as an option in the document class, say `\documentclass[french]{memoir}` and no package is loaded before `\usepackage[provide=*]{babel}`. As packages are already set accordingly, you should only be changing the region option in the document class.

1.5 Looks and customisation

1.5.1 *Make it yours!*

This version of the template was compiled with the colors of my engineering school. To do so, the color parameters `titlecolor` and `secondarycolor` were set by their RGB code, thanks to the `xcolor.sty` package. Their encoding can be changed at will to match your needs, see lines 5 to 10 in `common-packages.tex`.

There are two font types used in this document. The bodytext is typed in a classic seriffed font, Palatino Linotype, via its OpenType clone TeX Gyre Pagella. The latter can be changed with the `\setmainfont` command provided by `fontspec.sty`. Titles, page folios (pagination numbers), float labels and headers are typed in TeX Gyre Adventor. This can be modified by changing the `\setsansfont` command. Maths are also typeset in Palatino, via

`\setmathfont{TeX Gyre Pagella Maths}`. The use of TEX Gyre fonts, which are smart font clones of classic font types might require the install of the tex-gyre and tex-gyre-maths packages on the LATEXdistribution you are using.

When starting a new chapter, one might also want to print its outline under the title, as it was done here. To do so, the writer will call `\Chapter{<title>}` in lieu of the typical `\chapter` command. For better font consistency, looks and optimal resolution, I encourage the reader to make use of the `pgfplots` package for including their Figures. If so, to make sure numbers are lining and not in oldstyle, one may use the `\inputpgft` and `\inputpgfb` commands, see Figure 2.1 for an examle of their usage.

1.5.2 Lettrine

IF ONE WOULD LIKE TO INCLUDE LETTRINES, they can do so via the `lettrine` package which use initials from the `cfr-initial` package. `findent` is space between lettrine and first line. `nindent` is shift of indented lines to that of the first line.

1.6 Glossary

This template comes a with a glossary. To make use of it define entries in the `glossary.tex` file. Items can then be called by `\gls` and friends commands. The glossary is printed in the front matter, in two tables, one for abbreviations and another for symbols. The `glossary` package offers lots of customisation for theses tables. With my setup, making the glossary will require installing

- the `xindy` package and
- the perl software if it is not installed on your computer.

If your not interested by a glossary, load the `main.tex` file and get rid of

- `\makeglossaries` and
- all `\printglossary` commands.
